Excerpt: . . . same height as the observed oceanic tides. If the tides followed the equilibrium law, the rigidity in question could be determined by observation of the actual tides and calculation of the true equilibrium height. It would be necessary to confine attention to tides of long period because those of short period are not likely to follow the equilibrium law even approximately. Of the tides of long period the nineteen-yearly tide is too minute to be detected with certainty. The annual and semi-annual tides are entirely masked by the fluctuations of ocean level that are due to the melting of ice in the polar regions. From observations of the fortnightly tides which were earned out in the Indian Oeeant it appeared that the heights of these tides are little, if anything, less than two-thirds of the true equilibrium heights. If the fortnightly tide followed the...
